Paracetamol (APAP) - Repeated Supratherapeutic Ingestion

The combination of a low paracetamol concentration and an ALT<50 IU/L at any time indicates low risk of subsequent hepatotoxicity

- Continue full course of NAC
- Repeat ALT and paracetamol concentration at the end of the NAC infusion
- Cease NAC if paracetamol concentration is < 10 mg/L (66 µmol/L) AND ALT static/improved
- If paracetamol concentration > 10 mg/L (66 µmol/L) or rising ALT, measure INR, continue NAC (see Extended NAC Rx guideline) and discuss with a clinical toxicologist
